.bronchopneumonia, or gangrene, but in which the infecting agent is a species of streptothrix different from the cattle variety. About 30 cases of this kind have been reported (1900). Different species have been described, such as the Streptothrix eppingeri (Cladothrix asteroida), Streptothrix pseudotuberculosis, Flexner; Streptothrix hominis, Foulerton, and Streptothrix isneli. The organism is found in the sputum, often in the form of small, grayish-yellow granules. These are made up of a mycelium of branching organisms, which in the unstained specimen appear as fine, homogeneous, glistening threads, about two to four times as wide as a tubercle bacillus. They are acid fast, but can be decolorized with 1 R. Paltauf, Sitzungsber. d. K. K. Gesellsch. d. Aerzte Wien, 1880. alcohol. In such specimens many of the threads present a beaded appearance and sometimes seem to be breaking up into short rods of varying length. With Gram some...
